Technology used:

HTML-

The **<input type="tel">** HTML phone number input to create a specific field where users can submit a phone number. The **type="tel">** defines a field for entering a telephone number. The first step you are supposed to do is to include the HTML type attribute that **contains the 'tel' value** inside the HTML input tag. Also, you need to create a **unique identifier** so you can further style the default visual output of your

element using specific CSS properties. However, every HTML input element must have a label element that contains the contextual section of the field

→CSS

css is used in this project for design the backend structure for directory .
css is three types -external,internal,inline

About project

1. PHONE DIRECTORY

The task is to implement a search query for the phone directory. The search query on a string 'str' displays all the contacts which prefixes as 'str'. One special property of the search function is that when a user searches for a contact from the contact list then suggestions (Contacts with prefix as the string entered so far) are shown after user enters each character.

So here we create a code for phone directory in which we can store and search the number.

2. Objective of your Project

TO make easier for the user in use of phone directory and also store the phone numbers in systematic way

3. Briefly describe your Project

So here we create a code for phone directory in which we can store and search the number.

The `<input type="tel">` HTML phone number input to create a specific field where users can submit a phone number. `ut type="tel">` defines a field for entering a telephone number.

Please Note:

1. Font Family: Times New Roman
2. Font size:
 1. Heading: **(font size: 22 bold, center align)**
 2. Sub-heading: **(font size: 20 bold, left align)**

Paragraphs/Details: **(font size: 16, left align)**
